ART-UNIT: 1615

PRIMARY-EXAMINER: Spear; James M.

ATTY-AGENT-FIRM: BJ Associates Skutnik; Bolesh J. Ryan; Thomas J.

ABSTRACT:

A device and method is disclosed for permanent or semi-permanent removal of hair through the activation of microparticles introduced into hair follicles. Microparticles are incorporated into a composition that is topically applied to the skin. These microparticles containing or consisting of chromophores or chemically activated molecules are of a variety of shapes and sizes. Microparticles are within a size range of 1 micron to 70 microns, and preferably between 10 and 50 microns. Microparticles of this size and variety of shapes enter hair follicles on all areas of the skin without entering other areas of the skin, such as the stratum corneum or sweat gland channels. Treatment of the skin with electromagnetic radiation, ultrasonic radiation or chemical means activates the chromophore or chemically activated compounds, thus destroying the hair follicle without damaging other areas of the skin. In another embodiment, microparticles further contain nanoparticles released further into the hair follicle by use of a solvent or other method, allowing chromophores or chemically activated molecules to penetrate deeper into the follicle and avoid structures such as the sebaceous gland.

DOCUMENT-IDENTIFIER: US 6605080 B1

TITLE: Method and apparatus for the selective targeting of lipid-rich tissues

Brief Summary Text (6):

In addition, a major problem for teenagers and others is acne which originates at least in part from obstruction of outflow from a sebaceous gland. Certain drug treatments for acne operate through a mechanism of decreasing sebaceous gland output. Destruction, removal, or unblocking of the sebaceous gland, which gland contains lipid-rich tissue, in a non-invasive manner are therefore desirable alternatives for treatment or prevention of acne.

Brief Summary Text (7):

Another related problem is the removal of unwanted hair, and in particular the long-term or permanent removal of such hair by the damage or destruction of the hair follicle. Many techniques have been employed over the years for this treatment, including electrolysis, waxing and treatments with various forms of radiation, including light. However, electrolysis is slow and both electrolysis and waxing are painful to the patient and seldom permanent. Various radiation treatments, particularly those involving light, work more effectively for patients having darker hair than for patients with light hair and various proposals have been made over the years to add a chromophore in some way to the follicle to facilitate such treatments. The use of such artificial chromophores has not heretofore been particularly successful.

Brief Summary Text (15):

While the sebaceous gland may be heated to destroy the gland as part of an acne treatment, the sebaceous gland may also be heated to cause destruction of adjacent areas of a hair follicle, for example the stem cells of the hair follicle as a treatment to achieve hair removal and impede regrowth. Radiation in the indicated wavelengths may also be applied selectively to cells having lipid-rich membranes to porate the membranes to for example permit selective drug delivery to the cells or for other purposes for lipid-rich cells or tissue may be otherwise targeted and heated for affecting some other therapeutic function. Since the radiation fluence, pulse duration, wavelength and other factors may be carefully controlled, and the area to which the radiation is directed may also be controlled, selective lipid-rich cells may be non-invasively targeted to achieve the above and other therapeutic affects.

Detailed Description Text (44):

It is also known that the membranes walls of many cells are composed substantially of lipid and that these membranes differ somewhat from cell to cell. Radiation at one of the wavelengths indicated above may therefore be effective to selectively porate cells, the selectivity being achieved either as a result of controlling the focusing of the radiation to a targeted region and/or certain of the cells in the region porating at lower fluence or less time of radiation application than others as a result of cell size, wall thickness and/or other factors. Poration may be done for example to permit a drug or other therapeutic agent to enter the cell for healing or destruction thereof, for example, for the destruction of cancer cells, or to permit the content of the cell to flow out for various purposes. The poration may be temporary, or may be permanent resulting in cell destruction.

Feb 6, 2001

DOCUMENT-IDENTIFIER: US 6183773 B1

TITLE: Targeting of sebaceous follicles as a treatment of sebaceous gland disorders

Brief Summary Text (2):

Skin disorders, such as acne, can be irritating and embarrassing. The major disease of skin associated with sebaceous follicles, is acne vulgaris. This is also the most common reason for visiting a dermatologist in the United States. There are many treatments, but no cures for acne. These include antibiotics (which inhibit growth of *p. acnes* bacteria which play a role in acne), retinoids such as Accutane.RTM. (isotretinoin, which reduces sebaceous gland output of sebum), and antimicrobials such as benzoyl peroxide. Acne lesions result from the rupture of a sebaceous follicle, followed by inflammation and pus (a "whitehead"), or by accumulation of plugged material in the sebaceous follicle (a "blackhead"). This pathophysiology has two major requirements: (1) plugging of the upper portion of the follicle, and (2) an increase in sebum production. The upper portion of the follicle, i.e., the "pore" into which sebum is secreted and which is directly in communication with the skin surface, is called the infundibulum. A plug forms in the infundibulum from cells, sebum, bacteria, and other debris. The sebaceous gland continues to produce sebum (an oily fluid), stretching the infundibulum until either it or some lower portion of the follicles ruptures.

Detailed Description Text (7):

Sebaceous glands are components of the pilosebaceous unit. They are located throughout the body, especially on the face and upper trunk, and produce sebum, a lipid-rich secretion that coats the hair and the epidermal surface. Sebaceous glands are involved in the pathogenesis of several diseases, the most frequent one being acne vulgaris. Acne is a multifactorial disease characterized by the occlusion of follicles by plugs made out of abnormally shed keratinocytes of the infundibulum (upper portion of the hair follicle) in the setting of excess sebum production by hyperactive sebaceous glands. Various treatment modalities for acne exist that aim in modifying the rate of sebum secretion by the sebaceous glands (e.g., retinoids), inhibiting the bacterial overgrowth in the follicular duct (antibiotics), or decreasing the inflammation of acne lesions (anti-inflammatory agents). Most of these agents are not curative of acne and simply control the disease by affecting one of the aforementioned pathogenic factors. Oral retinoids are a notable exception: they are potent drugs that can achieve a significant cure rate for acne, but their side effect profile often limits their use. Advantages of the present invention include that treatment can permanently alter the pilosebaceous unit, rendering it no longer susceptible to pore pluggage without the side effects associated with oral retinoids.

Detailed Description Text (56):

In order to assure removal of plug 26, modification of pore opening 22, modification of the infundibulum 24, and/or modification of the sebaceous gland 20, use of a light source, e.g., a laser, having sufficient energy and depth of penetration is required. FIG. 3 demonstrates how an operator (not shown) will position the energy source 30, e.g., a laser, over a hair follicle 16 such that an optimum location for aiming the light pulse to strike the energy activatable material 28 about the plug 26, sebaceous gland 20, infundibulum 24 and/or pore opening 22 is obtained. The energy source 30 can be moved across the skin surface

in any direction 32 by the operator, thereby effectively irradiating multiple follicles 16 multiple times. The process can be repeated until the desired effect (s) are achieved.

TITLE: Phototherapy based method for treating pathogens and composition for effecting same

Brief Summary Text (89):

Oral therapy: The two oral antifungal drugs that have traditionally comprised the mainstay of the treatment of onychomycosis are griseofulvin and ketoconazole. These two oral anti fungal agents have been used for the treatment of onychomycosis for almost half a century. One of the major limitations of treatment with either griseofulvin or ketoconazole is the long duration of therapy required. In addition, the clinical and mycological cure rates are low, and there is a greater than 75% probability that the patient will relapse within two years. The potential for significant side effects is another problem, particularly with ketoconazole.

Brief Summary Text (92):

When orally administering any of these drugs, liver function monitoring becomes essential [Gupta et al. (1994) Continuing Medical Education Antigungal Agents: An Overview. Part II, 30:911-33].

Brief Summary Text (93):

Properties of an "ideal" oral antifungal agent most suitable for the treatment of onychomycosis would include favorable nail kinetics, good incorporation into the nail matrix, adequate diffusion through the nail bed, high clinical cure rate, high mycological cure rate, low incidence of relapse, effective when used for short-term therapy, low incidence of side effects, fewer drug interactions with other drugs or food, etc., and cost effectiveness.

Brief Summary Text (94):

Unfortunately, none of the oral anti fungal agents, neither the traditional nor the new generation drugs is ideal because of the potential for significant side effects, drug interaction, high incidence of relapse, long term therapy and high cost.

Brief Summary Text (97):

U.S. Pat. Nos. 5,226,907 and 5,425,728 to Tankovich discloses a device and process for the permanent removal of unwanted human hair. Hair is contaminated with a substance which strongly absorbs a specific wavelength of light. The skin is then illuminated by a laser producing light at the specified wavelength and at a sufficient intensity and duration to kill the follicles or the skin tissue feeding the hair. There is however no discussion of pathogens treatment using laser technology.

Brief Summary Text (114):

According to still further features in the described preferred embodiments the pigment is conjugated to an immunoglobulin or a drug which can specifically bind the pathogen.

Brief Summary Text (115):

According to still further features in the described preferred embodiments the

light absorbing material is selected from the group of consisting of lacquer dye, hair dye, India ink, scarlet red, D & C red dyes, toluidine blue, microcyanine, hematoporphyrin derivatives, photophrin II, chlorophyll derivatives, chlorin-E6, black ink, lycopene, carotenoids, 5-aminolaevulic acid, benzoporphyrin derivative monoacid, tetra (m-hydroxyphenyl) chlorin, N-aspartyl chlorine-E6, tinettiopurin, anti-malarials, phenothiazines, clofazimine, minocycline, zinc phthalocyanine derivatives, a combination of photo dynamic therapy with bioreductive drugs, carotene, lycopene, riboflavin, silver, gold, mercury, bismuth, iron, zinc, copper, picric acid, dinitrophenol, iron salts, pararosaniline chloride, acid lost stains, phenol red, carbol fuchsin, H.sub.2 SO.sub.4, methylene blue, bromcresol, brilliant green, ascospore stain, bromcresol purple, calcofour stain, Evans blue, Giemza stain, Tween 80, gomori methenamine silver stain, gram stain including hucker modification, loctophenol cotton blue, loctophenol cotton blue with polyvinyl alcohol (PVA), bromthymol blue, eosin gentian violet, thiopyronin, phthalocyanine and chloraluminicin.

Detailed Description Text (16):

In addition, there are drugs which are used to treat various non-related conditions which are known to induce nail pigmentation as a side effect. One example are the anti-malarial drugs chloroquine (aralene), quinidine and amodiaquine, which induce a blue-brown nail pigmentation, due to melanin-antimalarial drug complexes deposition in the nail bed and plate. Another example is minocycline used to treat acne vulgaris which induce a blue nail pigmentation due to iron-drug complexes deposition. Other examples are listed in Fitz Patrick et al. (1993) Dermatology in General Medicine. McGraw-Hill, N.Y., p. 704. Such a drug may therefore serve as a carrier for the pigment to reach specifically to the nail. However, the phenomenon of drug associated nail pigmentation may serve per se for providing a light absorbing substance according to the invention.

Detailed Description Text (22):

A pigment incapable of specifically binding the pathogen may be made specific by having it conjugated to an immunoglobulin or drug which is specific to that pathogen. Anti-Trichophyton sp., anti-Candida sp., anti Aspergillaceae sp. mono- and polyclonal antibodies are available from Ecopath Aspergillus, Institute Pasteur, Genk, Belgium. Antibodies specific for other pathogens are also available. If the pathogen corresponding to the antibody applied is present, it will be labeled, and rendered pigmented by, for example, direct immunofluorescence, immunoperoxidase reaction, or avidin-biotin complex formation methods, as well known in the art.

Detailed Description Text (23):

One ordinarily skilled in the art would know how to conjugate various pigments to various immunoglobulins and/or drugs without affecting the specific binding capabilities of the latters and the pigment characteristics of the former.

Detailed Description Text (24):

Thus, according to the present invention the pigment may be a dye, a drug or any substance which absorbs light at a desired wavelength.

Detailed Description Text (27):

Examples of drugs which can be used include 5-aminolaevulic acid (ALA), benzoporphyrin derivative monoacid, tetra (m-hydroxyphenyl) chlorin, N-aspartyl chlorine-E6, tinettiopurin, anti-malarials, phenothiazines, clofazimine, minocycline (tetracycline), zinc phthalocyanine derivatives and a combination of photo dynamic therapy (PDT) with various bioreductive drugs.

Detailed Description Text (38):

Active transdermal delivery is well known in the art. Few strategies are employed for transdermal active drug delivery via active pads.

Detailed Description Text (42):

Further details concerning the functionality and precise construction of active pads are well known in the art. Such details are found, for example, in "Breaking the skin barrier" (1996) by Ingrid Wickelgren, Popular Science, December, pp. 86-89; "Controlled drug delivery fundamentals and applications" Second edition (1987) J. R. Robinson and V. H. L. Lee editors, Marceldekker Inc. New York, and U.S. Pat. Nos. 5,169,384; 4,763,660; 5,443,441 and 3,447,537, all are incorporated by reference as if fully set forth herein.

Detailed Description Text (66):

After having treated the affected area of skin, the patient is recommended to avoid sun exposure for about a month, as well as to use sun blockers to prevent inflammation. The patient is also recommended to use a topical antibiotic ointment, gel, or cream. For local irritation, the use of steroids, topical or systemic anti-histamine, or other contra-irritant agents (e.g. Aloevera) is recommended.

CLAIMS:

12. The method of claim 11, wherein said pigment is conjugated to an immunoglobulin or a drug which can specifically bind the fungal pathogen.

13. The method of claim 1, wherein said light absorbing material is selected from the group of consisting of lacquer dye, hair dye, India ink, scarlet red, D & C red dyes, toluidine blue, microcyanine, hematoporphyrin derivatives, photophrin II, chlorophyll derivatives, chlorin-E6, black ink, lycopene, carotenoids, 5-aminolaevulinic acid, benzoporphyrin derivative monoacid, tetra (m-hydroxyphenyl) chlorin, N-aspartyl chlorine-E6, tinetiopurin, anti-malarials, phenothiazines, clofazimine, minocycline, zinc phthalocyanine derivatives, a combination of photo dynamic therapy with bioreductive drugs, carotene, lycopene, riboflavin, silver, gold, mercury, bismuth, iron, zinc, copper, picric acid, dinitrophenol, iron salts, pararosaniline chloride, acid fast stains, phenol red, carbol fuchsin, H₂SO₄, methylene blue, bromcresol, brilliant green, ascospore stain, bromcresol purple, calcofour stain, Evans blue, Giemsa stain, Tween 80, gomori methenamine silver stain, gram stain including hucker modification, loctophenol cotton blue, loctophenol cotton blue with polyvinyl alcohol (PVA), bromthymol blue, eosin gentian violet, thiopyronin, phthalocyanine and chloraluminicin.

L7: Entry 6 of 18

File: USPT

Jan 27, 1998

DOCUMENT-IDENTIFIER: US 5711761 A
TITLE: Iontophoretic drug delivery

Detailed Description Text (51):

The iontophoretic device was placed posteriorly on the rabbit, the hair having been clipped and removed with a dipilatory. The device was then attached by means of an adhesive for the duration of the experiment. During the experimental procedure, blood samples were removed from the subject rabbits. Where rabbits were anesthetized, blood samples were removed from their inferior vena cava by means of a catheter inserted into the femoral vein. For the experiments employing constrained (rather than anesthetized) rabbits, blood samples were pulled from the heart by means of a catheter inserted into the marginal vein of the rabbit's ear. The samples thus withdrawn then were analyzed for the drug which was iontophoretically introduced therein.

Apr 8, 1986

DOCUMENT-IDENTIFIER: US 4581148 A
TITLE: Depilating composition and method

Brief Summary Text (30):

One of the major problems encountered in highly alkaline dipilatory compositions has been the swelling of the hair root in the follicle without weakening of the bond between the bulb and the surrounding chemical layer which then interferes with effective removal of the hair shaft using conventional procedures.

US-CL-CURRENT: 252/8.57; 8/94.16, 8/94.18

CLAIMS:

What is claimed is:

1. A composition for dissolving hair comprising:

Approx. Wt. (%)	
Water	87.00-94.00
Sodium Hydroxide	4.00-8.00
Trisodium Phosphate	2.00-3.00
Sodium Gluconate	0.25-1.00
Triethanolamine Dodecyl Benzene	0.10-0.50
Sulfonate	
Sodium Metasilicate	0.10-0.50

2. A composition for dissolving hair comprising:

Approx. Wt. (%)	
Water	89.15
Sodium Hydroxide	7.25
Trisodium Phosphate	2.50
Sodium Gluconate	0.50

Triethanolamine Dodecyl Benzene
0.30-Sulfonate
Sodium Metasilicate 0.30
